

# Security you can bank on

## Trackable after hours access for your vendors

Want to enable one of your vendors to access a bank branch, after hours? What about a remote site like an ATM kiosk? To perform those tasks, most branch managers must resort to duplicating keys or arranging vendor meets.

The TRACcess system is a reliable and economical alternative. TRACcess is more secure than providing vendors duplicate keys to your sites and more cost effective than scheduling vendor meets.

TRAC-Vaults are installed on each branch and one set of building keys are placed in the vault by the branch manager. Bank vendors — such as ATM service vendors, security companies, and cash handlers — purchase DisplayKEYs that they then assign and distribute to specific employees.

### Reduce risk of lost or stolen keys

Unlike mechanical keys, a DisplayKEY may not be used without a valid PIN code. And if the DisplayKEY is lost or stolen, it can simply be deactivated.

### Eliminate need for duplicating keys

No need to duplicate mechanical keys for vendors. One set of keys is locked securely in the TRAC-Vault at each branch. This reduces costs and key management time.

### Monitored access

An audit trail showing who accessed keys at a TRAC-Vault is available to both the Bank organization and its vendors. Every access is automatically tracked, recorded and sent to a secure, central web-based server.

Banks authorize specific vendors to access their TRAC-Vaults. A vendor employee carries only one DisplayKEY to access branches for multiple banks throughout their territory.

## UL® listed means bank keys are secure

Underwriter Laboratories, an independent product safety organization, has certified that the TRAC-Vault meets stringent attack test requirements.

## Electronic keys

Each electronic key has a unique PIN and serial number. DisplayKEYs are assigned to individual vendor employees. Employees are then granted access to specific TRAC-Vaults. Individual access rights can be restricted to a single location. DisplayKEYs store over 250 access events and transmit event records to a central database.

## Everyone wins with TRACcess

Eliminate worries about lost keys or ATM downtime during rekeying. Reduce the unauthorized copying of keys and rekeying expenses if a key is lost or stolen. Bank branch managers and bank vendors can view secure access records.

## Experience matters

UTC Fire & Security is the largest worldwide supplier of lockbox systems. In business since 1955, we've sold over 6 million lockboxes. The TRACcess system is now in use by banks with thousands of branches and the top ATM security companies.

### TRAC-Vault

The TRAC-Vault mounts securely on the surface of any structure and provides ample space for keys and access cards. TRAC-Vaults also capture access data.

### DisplayKEY

Carried by vendors, this PIN controlled device operates and powers the TRAC-Vault, eliminating the need for keys.

### Recessed TRAC-Vault

The recessed TRAC-Vault features the same solid construction and functionality as the TRAC-Vault. It is ideal for incorporating into new construction projects.
